Overview

What does the script do?

The script takes a CSV file of annual hourly user data and imports the data as a freeform profile in to the project ApPro profile database.

The user should use ApPro to rename the subsequent import.

Running the script

The script can be started from the VE Python Scripts navigator, or from the integrated editor by running FFD_create.py from the installation Scripts\tools folder.

The script prompts the user to select a CSV file.

When the CSV file is imported, the script finishes execution.
