Overview

What does the script do?

The script generates a CSV file in the project root folder of annual hourly data with default values that the user can then overwrite with user free-form hourly values.

Use Free-form profile – import CSV to import the data as a freeform profile in to the project ApPro profile database.

Running the script

The script can be started from the VE Python Scripts navigator, or from the integrated editor by running FFD_csv.py from the installation Scripts\tools folder.

When the CSV file is created, the script finishes execution.
